METHOD OF MIGRATING ACTIVE GENERAL SERVICE MANAGER FUNCTION

Abstract of the Disclosure

5   InfiniBand architecture subnet management includes providing an InfiniBand architecture subnet (200) with a master subnet manager function (206) managing the InfiniBand architecture subnet (200), where the master subnet manager function is located at a first node (202) of the InfiniBand architecture subnet. An active general service manager function (208) manages a service (214, 218) within the InfiniBand architecture

10   subnet, where the active general service manager function is located at the first node. The master subnet manager function migrates to a second node (204) and the active general service manager function as well as the active managers migrate to the second node to co-locate with the master subnet manager function.
